By consulting with well established timber merchants throughout Wentworth Gold development we have been able to provide functionality that will ease the flow of an order through to delivery from a simple trade counter purchase to a bespoke job of work that will include milling and treatment services.

- Works order and milling via cash order, account orders and quotes.
- Works order warehousing and locations
- Finished goods warehousing and locations
- Current stock used for works order
- Works order pick list
- Works order costing
- Works order enquiry
- Milling and service charges
- Finished goods putaway
- Waste and return to stock calculation
- Purchase ordering referencing for out-of-stock items
- Tally Calculations
- Works order milling to stock or on order
- Multiple uom entry; metric, and imperial
- Stock references

## Milling Work Orders Overview

The timber sales order processing module extends the Wentworth Gold merchant system to accommodate the calculation of timber tally and milling services. Any stock can be identified as being available to use by milling work orders which will invite users to enter the stock items, treatments, tally items or services they need to complete the finished product.

During this time goods are moved from storage and can be seen as work in progress inside a warehouse or workshop. A pick list of components is provided to allow the collection of goods for this move. Pick lists will identify out of stock components and reserve components in stock.

Multiple units of measure in imperial and metric can be assigned to the products so they can be sold singularly, or by other units of measure. Further stock references can also be applied to identify batch numbers, serial numbers etc.

During the configuration of the works order, which can be done through cash sales, accounts sales and quotations the standard stock descriptions can be amended as well as notes and instructions added. Quotations can be converted to a confirmed order once authorised.

Purchase ordering can include details of the works order the goods relate to. When they arrive at goods-in, details are included and a works order indicator to direct the goods into to the work-in-progress location.

Confirmed works orders may be amended and also allow users to record any wastage or unused goods that need to go back into stock and update system reserves.

Works orders can also be created when items are being made to go back into stock as an saleable finished product.

### **Timber Tally**

During order and quotation entry, users are directed to enter a breakdown of pieces and their width, length and depth. This allows the price of multiple lengths and dimensions to be calculated by tallying up the total volume, area or linear amount. These calculations are presented up to 4 decimal places. Changes after picking of both the tally quantities and prices are permitted before confirming the final order to be despatched and invoiced.
